

5 **Amendments in the Specification:** (struck-through parts deleted and underlined parts added)

Beginning at page 5, line 1:

A head 38 has a bottom side 40. The bottom side 40 has a hole 42 extending upwardly therein. The hole 42 preferably has a frusto-conical shape. The head 38  
10 preferably includes a face and other details so that the head appears to be the head of a person. Ideally, the head 38 is oversized with respect to the torso ~~portion~~ section 22. A second spring 44 attaches the neck 34 to an upper wall of the hole 42 such that the neck 34 extends into the hole 42 and the head 38 is movable with respect to the neck 34. The second spring 44 is generally vertically orientated for the same reason as the orientation  
15 of the first spring 36.

Figure 3 depicts couplers 46 for attaching the springs 36, 44 to the body sections 16, 22, 38 of the doll assembly 10. The couplers 46 have first ends 48 that are extended into the body sections of the doll assembly 10 and a second end 50 having a channel 52 therein for receiving an end of the springs 36, 44. The channel 52 is arcuate so that the  
20 spring may be twisted into the channel 52. The couplers 46 offer an efficient way of attaching the springs 36, 44 to the body sections while also allowing the body sections to be replaced or changed.
